"Evaluation of the Number and Biomass of Fish in the Drainage Channels
of the Zitny Ostrov Island."

Bratislava, Biologia, Vol 18, No 6, 1963; pp 47-449.

Abstract [German summary modified]: Study primarily of methodology how
to catch fish in well-defined area, and how to calculate from such
successive catches numbers and weights of fish mass per given area or
volume. Several methods give variable results and further studies are
in course. Four tables, graph; 2 Western, 5 Czech and 1 Soviet reference.

SOV/6246

Soveshchaniye po tsseolitam. 1st, Leningrad, 1961.

Sinteticheskiye tsseolity; polucheniye, issledovaniye i primeneniye
(Synthetic Zeolites: Production, Investigation, and Use). Mos-
cow, Izd-vo AN SSSR, 1962. 286 p. (Series: Itst: Doklady)
Errata slip inserted. 2500 copies printed.

Sponsoring Agency: Akademiya nauk SSSR. Otdeleniye khimicheskikh
nauk. Komisiya po tsseolitam.

Resp. Eds.: M. M. Dubinin, Academician and V. V. Serpinskiy, Doctor
of Chemical Sciences; Ed.: Ye. G. Zhukovskaya; Tech. Ed.: S. P.
Golub'.

PURPOSE: This book is intended for scientists and engineers engaged
in the production of synthetic zeolites (molecular sieves), and
for chemists in general.

Card 1/244

Synthetic Zeolites: (Cont.)

SOV/6246

COVERAGE: The book is a collection of reports presented at the First Conference on Zeolites, held in Leningrad 16 through 19 March 1961 at the Leningrad Technological Institute imeni Lensoveta, and is purportedly the first monograph on this subject. The reports are grouped into 3 subject areas: 1) theoretical problems of adsorption on various types of zeolites and methods for their investigation, 2) the production of zeolites, and 3) application of zeolites. No personalities are mentioned. References follow individual articles.

✓ Manufacture and properties of resistance wires of composition Cu 82.5, Mn 12.0, Al 4.0, and Fe 1.5% (A. Kowalski and Z. Vislocki, Prace Badawcze Głównego Inst. Met., i Odlewarki no 2, 273-841 1980) (English summary). — Manuf. of novo-constantan (I), elec. resistance wire, is described. A mixt. of pure metals or alloys is melted in an elec., gas, or cok. furnace. Each batch is covered in the crucible with a mixt. of ground glass and 10% of CuO. Reduction is carried out by the addn. of Al at the end of melting. Casting is done at 1210-1240°. Afterwards "homogeneous" annealing is applied by heating for 12-14 hrs. to 900°. Subsequen. rolling is performed in hot or cold condit. In the latter case "softening" annealing at 700° for 1 hr. is applied. During subsequent drawing annealing as above has to be applied. The wire thus obtained is now annealed for recrysn. for 2 hrs. at 400-500° in a protective atm. After the latter operation specific resistance (sp. r.) of I is 0.46-0.48. By carrying out the "recrysn." annealing below 400° values for sp. r. are better, reaching even 0.52; the wire is, however, brittle. The chem. compn. of the wire may vary within a certain range without changing its elec. and mech. properties. This range is Cu 82.50-84.80, Mn 11.30-12.00, Al 2.64-4.00, and Fe 0.52-1.50%. Although specifications require Si to be not more than 0.1, it was found that even 0.25% has no bearing on the properties.

 Misiotek Z., Wyszkowski R. The Method of Producing Bimetallic Copper-Steel Conducting Wires

Metoda produkcji bimetalowych drutów przewodzących "miedz-stał"
 Prace Inst. Metallurgii No. II, Katowice, 1952, Powt. 15 pp., 15 illus.
 13 tabs.

Of the two principal methods of producing bimetallic wires, that which involves pouring molten copper over suitably prepared steel billets is, through the works published by L. Glazburg [in: M. G. and F. Paterson well known; on the other hand, there is a shortage of exact information as to the method of pressing steel cores into rolled cones] to the conclusion that the method involved in the first method lead the authors tubes will be the most economical in current conditions. Lackung precise data concerning this method, the authors conducted trials on a semi-industrial scale, basing their determination of the dimensions of the copper tubes and the steel core on the conditions given in the GOST 3822-47 standard, and, on account of a higher drew voltage of copper than of steel core during rolling, adhering a higher ratio (12.59) of "was used for the tubes which were rolled on the eleven-span tube mill. Before having the core pressed into them the tubes were bored to an appropriate diameter, and etched. The cores of armco grade steel were degreased, etched and coppered. The bimetallic billets were, after pressing and in order to obtain better adhesion of the two metals heated in a temperature of 900°C for 3½ hours; then, before rolling, the billets were water cooled and rolled from the diameter 22.0 mm to 3.0 mm. The conditions of rolling were established experimentally, the sequence of passes was ascertained by rolling soft steel billets, and the

(Other)

mean elongation coefficient was calculated according to the Winogradow formula. The flow of the metal was calculated by means of Z. Wusatowski's formula with the help of A. Wojsyla's special sliding rule. It was established that the flow of the bi-metal in grooves depends on a) the temperature difference between steel and copper, b) the rate at which the copper flows over the core, c) the parameters determining the flow conditions of the metal in the process of hot-rolling. The rolled rods, were, after checking, drawn to the diameter of 3.0 mm. For tests on production scale, DSA grade steel in rods rolled according to PN/H-93216 and tubes rolled in exact dimensions according to FN/B-1002 were used instead of the armco grade steel. Tests were made for two grades of wire with the section ratios, copper to steel 30/70 and 40/60. The procedure given in the initial tests was followed for rolling and drawing. On examining the properties of the wire obtained, the necessity of inter-operation annealing was established and its conditions determined. It was concluded, however, that that necessity would make the use of DSA grade steel uneconomical.

productivity of electrolytic Cu-Fe wires may be increased by
compressing of pressing Fe rods into rolled Cu tubes and reducing them
to the desired dimensions by hot-rolling and drawing into wires by
investigation. A report of the tests on the laboratory and semi-
industrial scale illustrated by tables and diagrams is given. A cost-
piet roll pass for full scale production of Cu-Fe wires is designed.
The use of more expensive Armco Fe rods is recommended as this
makes possible the avoidance of inter-stage annealing at 735°
necessary with mild steel rods.

Murski C., Wusztowski Z., Mistolek Z. Plating Soft Carbon Steel Sheets with Stainless Steel.

„Platerowanie blach z miękkich stali węglowych blachami kwasoodpornymi”. (Prace Inst. Materiałistyczno-Technicznych No. 5), Katowice, 1952, PWT, 95 pp., 16 figs., 3 tabs.

This paper contains definitions of plated products, a review of commonly used production methods and examples of applying them. The authors discuss their own method of plating soft carbon steel sheets with stainless steel. This method is a variation on rolling in packets, the packeting being done not by means of interposing rods but with external packing by means of a strip. Investigations were conducted on thick sheets of rimmed carbon steel with about 0.15% C, plated with stainless steel sheets, of 18/8 type, titanium stabilised. It was assumed that if good results were obtained for these materials, then still more satisfactory results should be obtained from plating with other kinds of 18/8 type stainless steel. Individual operations described are: preparatory work, heating and rolling the packets, heat treatment and etching of finished sheets. The plated sheets obtained by this method were tested for technological and mechanical properties and submitted to metallurgical examination. On the basis of the results obtained, the value of this method in the production of plated sheet metal was ascertained, and guiding principles for production were established.

Resistance strips of Inmet (copper-manganese-aluminum) alloy. Z. Miszak / Prace Instytutu Fizyki 1951, L. No. 3, 120.
The influence of annealing, hot and cold working, and heat-treatment of Inmet (Cu 83.5-85.0, Mn 11.3-12.0, Al 2.6-3.0 and Fe 0.5-1.5%) are described. Measurements of the electrical properties show that Inmet strips satisfy the requirements laid down for resistance materials, and that they are suitable for the production of precision resistances. The best-quality strips are obtained after annealing the cold-worked material for 2 hr. at 400°.

Technology of wire production for thermoelectric materials. J. Pawl, Z. Misiak, and W. Pacholski. Zeszyty Naukowe Politechniki Szczecinskiej, Seria 1, Mechanika, No. 10, 1973. Properties of Cu-Cu, Ti-Cu, and Cu-Ti-Ni binary alloys. A very competitive property according to a plot, made for thermocouples with wires of the upper limit, limit Pt-Pt10%Rh, Cu-Cu10%Ni, Cu-Cu10%Ni10%Cr (19%), Pt-Constantan (19%), Pt-Cu60 (30%), Chromel-Copel (14.7%), Cu-Costalum (40%). The temp., and thermoelectric potentials were measured by aid of the following standard thermocouples: Pt-Ir, Rh, Ir, Rh/Ir, Pt, W-Wr, Ni-NiO. The gmt. of melting metal and wires can melt ice in order to prep. the allies for these wires is described, and how to melt, cast, coldwork, and anneal them. Example: Use steel so that its limit validity will be Cu 54.34, Ni 15.09, Mn 0.11, Fe 0.073, C 0.025, and S 0.055%. It must then be kept for 34 hrs. at 80°C in an electric furnace, followed by raising the temp., to 1120°C over 4 hrs., and keeping at this temp. for 1 hr. The temp. is then allowed to drop from 1090 to 950°C of which time the piece is hammered either plastically or twice at 900-1000°C.

TEXT: A detailed consideration of the chemical and mechanical properties of modern nickel alloys, as required for preparing the cores of oxide electron tube cathodes. Chemical compositions of nickel alloys, as set by industrial norms and standards of the Polish People's Republic, are compared. Comparison is also made with standards of other nations. A description of experiments carried out in Poland during development of the technological processes and of properties of nickel-silicon, nickel-aluminum and nickel-tungsten alloys, is given. Diagrams of studied states are given. Methods of obtaining nickel alloys in evacuated induction furnaces with buffer

and fusing agents are given (evacuation 1000 l/sec, pressure 10^{-5} mm Hg). The technology of making tapes of the discussed materials is given. The influence of the following technological factors is analyzed: Influence of furnace charge and flux composition, the conditions of melting and of casting in vacuo, the conditions of rough and final mechanical processing, the conditions of annealing in hydrogen. A comparison of the mechanical properties of multicomponent alloys is given. From the results obtained at the Polish Institute of Non-Ferrous Metals it was established that the described alloys can be obtained in evacuated induction furnaces. Hypothyroidism and inflammatory reactions. Z. Teplova, A. Nikulin, P. Steg, A. Mikhlin, and M. Cigler (Med. Fak., Saratov, Yugoslavia) and Endocrinol. 73, No. 1, p. 109, 1979. The reaction to croton oil injection into the granuloma pouch of rats was weaker in thyroidectomized rats than in normal animals. This is explained by a lower histamine content of the skin of thyroidectomized rats. Removal of histamine from the skin of thyroidectomized rats caused inflammatory reactions.

TITLE: Effect of temperature on the collision broadening of the Cd resonance line at 3261 Å, due to hydrogen pressure

PERIODICAL: Referativnyy zhurnal, Fizika, no. 4, 1962, 11, abstract 4V69
(Temperaturos itaka vandenilio slegiminiam Cd rezonansines linijos
3261 Å isplitimui. "Vilniaus univ. Mokslo darbai. Matem., fiz.,
Uch. zap. Vilnyussk. un-t. Matem., fiz.", 1960, v. 33, no. 9,
135 - 138, Lith.; Russian and English summaries)

TEXT: The authors investigated the effect of increase in temperature on the width, the shift of the maximum and the asymmetry of the Cd resonance line at 3261 Å, broadened by hydrogen. The concentration of Cd vapors was equal to $2.17 \cdot 10^{16}$ atom/cm³, and the hydrogen pressure at room temperature was 1/2 atm. By the total absorption method it was established that the half-width of the Cd resonance line at 3261 Å, broadened by hydrogen, increases by $(28 \pm 12)\%$ with increase in temperature from 803° to 1,253°K and the maximum of intensity is shifted to the long-wavelength side by (0.10 ± 0.06) Å, while the asymmetry almost

TITLE: Controlled-hazard level-mode sequential circuits

SOURCE: Archiwum automatyki i telemekaniki, v. 11, no. 4, 1966, 479-489

TOPIC TAGS: transistorized circuit, ~~automation~~, ~~telemekanics~~, sequential circuit,
~~asynchronous sequential circuit~~, ~~level-mode sequential circuit~~, ~~controlled hazard~~
~~sequential circuit~~, gated oscillator, ring counter, binary trigger, shift register

ABSTRACT: Asynchronous, level-mode, controlled-hazard sequential (transistorized) circuits were studied. The controlled hazard was defined as a hazard whose effects are determined according to input and output delays of certain logic elements. It was shown that proper introduction of the controlled hazard makes further merging of the flow table possible than can be achieved with level-mode circuits only. Synthesis methods for controlled-hazard circuits are given, and units such as the

ANALYSIS OF CERTAIN TYPES OF BARIUM DIFFUSION CATHODES

DEUTSCHE METALLFORSCHUNG, VOL. V, NO. 17, 110-20 (1956). M. Karik, R. S. Stober, and H. D. Oster. Three types of diffusion cathodes, namely, Ba-W cathodes impregnated with barium aluminates, Ba-Ni pressed cathodes, and Ba-Ni pressed and reduced cathodes were investigated in a high-pressure mercury-argon filled quartz lamp. The cathodes were in the shape of a disc or a pill made of porous sintered metal (W or Ni). The experiments showed that the life of diffusion cathodes in quartz lamps is substantially longer than that of oxide-coated cathodes.

TITLE: Oxide cathode in low-pressure discharge conditions within a fluorescent lamp

SOURCE: Slabopredu obzor, v. 26, no. 12, 1965, 716-724

TOPIC TAGS: fluorescent lamp, cathode, discharge plasma, electronic circuit

ABSTRACT: The paper deals with the oxide cathode, which facilitates transmission of the charge between the discharge plasma in the tube and the external electrical circuit. A suitable method of measuring the emissivity of a cathode in low-pressure discharge will facilitate development work in the designing of new fluorescent lamps as well as in production checks. The paper states the results obtained by other authors as well as the method used in the present work. The principle is to find the point of zero potential in the cathode and to determine the R_T/R_0 cathode resistance ratio for that point.

Miskarli, A.K.

Effect of water on the quality of drilling clay suspensions.
A. K. Miskarli. Trudy Inst. Khim. Akad. Nauk Azer-

bol'shun. S.S.R., 9, 5-58 (1958) (in Russian).—A bentonite

clay (exchange capacity = 94 meq./100 g.) and 2 drilling

clays (exchange capacity = 20 meq./100 g.) were suspended

in water or salt solns. at const. initial viscosity. After 1 day, suspensions contg. 1-10% of CaCl₂, MgCl₂, NaCl, or MgSO₄ were not stable, while those contg. 1-5% of NaHCO₃, Na₂SO₄, or CaCO₃ were as stable as suspensions in distilled water. Up to 1% of Na₂CO₃ or NaOH increased the stability of the clay suspensions. Bentonite was more sensitive to salt concn. than were the drilling clays. Lignite, waste sulfite liquor, and sodium hexametaphosphate in various combinations were tested as stabilizers, but were not generally effective in the presence of more than 1% of salt of the CaCl₂ type. The best stabilizer was made by mixing 150 g. starch and 62.5 g. of 30% NaOH in 1600 cc. H₂O with 600 cc. of a suspension contg. 225 g. sulfite liquor and 45 g. NaOH. It was used with 3 kg. clay. R.G.M.

Miskari, A.K.

(1)

Pyrite ash as a weighting agent for clay suspensions.
A. K. Miskari, M. M. Gurvich, and R. G. Gadzhieva,
Trudy Inst. Khim., Akad. Nauk Azerbaidzhan. S.S.R. 9,
69-87 (1952) (in Russian). — Pyrite ash can be used to obtain
a stable clay suspension of d. 1.7 if boiled starch or spent
gumkrin, together with a. oil, contg. 25% anhyd. vinasse
and 5% NaOH (I), or 10% lignite and 2% NaOH (II),
are added as protective coloids. The most stable suspen-
sion resulted when 5 parts by wt. of starch and 25 parts of I
were mixed and added to 100 parts of clay in suspension.
Then 400 parts of pyrite ash was added with water to give
the desired viscosity. Spent gumkrin, a bentonitic clay,
also gives stable suspensions when used with a 1:1 mixt. of I
and II. Spent gumkrin loses its effectiveness when ad-
sorbed matter is removed by extn. with benzene.

Ronald G. Menzel

MISKARLI, A.K.

Replacement of caustic soda by sodium sulfide in the
chemical treatment of clay mortar. I. L. Baghanty, M. M.
Gurylich, and A. K. Miskarli. *Trudy Inst. Khim. Akad.
Nauk Azerbaidzhan. S.S.R.* 13, 114-20 (1954) (in Russian).
Na₂S solns. have been used to ext. humic substances from
brown coal. Their use for extn. of humic substance from
clay mortar is proposed. Caustication of Na₂S by lime is
negligible, but hydrated Fe oxide can give solns. whose
NaOH/Na₂S ratio is 01.5/8.5, although with loss of sulfide
amounting to as much as 43%. The residual sulfide in the
thus obtained soln. is oxidizable by air; after such oxidation
the soln. loses its odor and no longer attacks Ce surfaces.

MISKARLI, A. K. - "The Development of the Technology of Preparing and Using
Clay Suspensions for Boring Oil Wells under the Complex Geological
Conditions of Azerbaijan." Inst of Petroleum. Acad Sci USSR. Moscow, 1955.
(Dissertation for the Degree of Doctor in Technical Sciences)

So: Knizhnaya Letopis' No 3, 1956

Name: MESKARLI, Abbas Kulam-ogly

Dissertation: Devising the technology of preparation and application of argillaceous suspensions for drilling petroleum wells under the complicated geological conditions of Azerbaijan

Degree: Doc Tech Sci

Affiliation: Inst of Chemistry, Acad of Sci
Azerbaijan SSR

Defense Date, Place: 16 Feb 56, Council of the Inst of
Petroleum, Acad Sci USSR

Certification Date: 8 Jun 57

Source: BMVO 16/57
